

**Fig. 5** Phylogenetic tree of bacterial *amoA* sequences retrieved from sediments of the Dajihu River and by the ML method with a bootstrap of 1,000. All reference sequences were obtained from GenBank. Sequences in bold were from this study. Numbers after the OTU indicated the clone numbers in the OTU. Scale bar represents 0.05 nucleic acid substitutions per nucleotide position. Bootstrap values  $\geq 50\%$  was shown close to the nodes of the tree.
